## SATI | Innovative practices in the digital era
E-Learning Platform launch

The e-learning platform is ready and fully operational with all the partners involved in it.

The main scope is to serve the training requirements of the project and support the trainees during the project and after the end of it.

Open & distance learning

Agriculture, Forestry & Fisheries
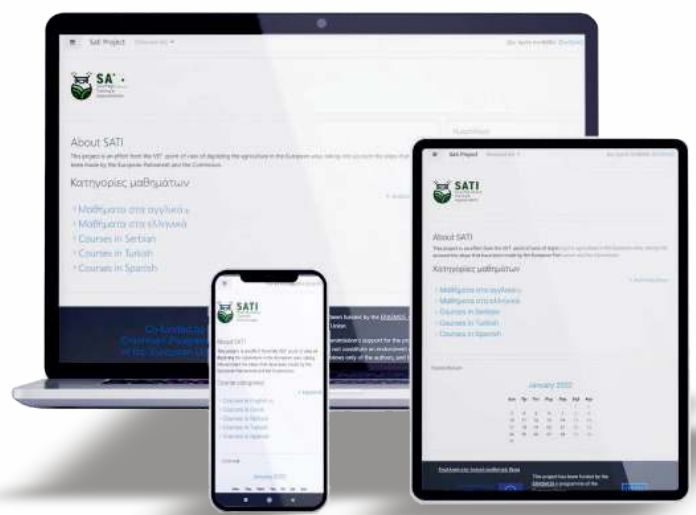

ICT New Technologies Digital Competences

In the context of the European project "SATI-Smart Agriculture Training and Implementation the project team **designed and developed an e-learning platform with multiple recipients**, that will play 3 main roles during and after the end of the project.

The platform, based on commercial e-learning platforms, provides those interested with **distance education** supporting the professional development of people working in vocational education and Training (VET).
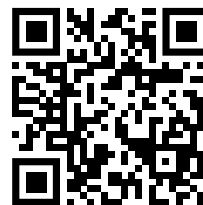

The program will lead to the Certification of a Precision Agriculture Analyst.

3 main roles

☑ The first is to serve the training requirements of the project and support the trainees during the project and after the end, as it is a requirement for this platform to be available for at least a certain period.

☑ The second is to serve as a communication tool among the partners and trainees with partners and teachers.

☑ The third role of the platform is as a dissemination tool, either by presenting the overall activities and partnership of the project or as a channel for promoting the Intellectual Outputs of the project.
